

**DISPLAY AND DOOR SHOCK MOUNTING
CONFIGURATIONS FOR GAMING MACHINE**
ABSTRACT OF THE INVENTION

A gaming apparatus for presenting a game comprises a cabinet and a door connected to the cabinet. In one embodiment of the invention, a door shock is mounted between the door and the cabinet. The door shock includes a piston selectively extendable from a body. The door shock dampens the closing of the door. Another embodiment of the invention comprises a display mount. At least one bracket extends inwardly from a door, the bracket including one or more apertures. The display or a frame connected to the display includes one or more apertures. In one embodiment, fasteners such as screws generally affix the display to the door by engaging the bracket and the apertures in the display or display frame. In another embodiment, the apertures in the bracket comprise slots and bushings extend from the display or display frame and engage the slots.
